I came to the position that mathematical analysis is not one of the many ways of doing economic theory: it is the only way.

R. Lucas

# Lecture 12 Sec. 6.3, 6.10-11, 8.1-2, 8.4, 8.6 Rules for differentiation. Optimisation (one variable).

Here are recommended exercises from the textbook [SHSC].

Section 6.1 exercise 1, 2

Section **6.2** exercise 1, 6, 8

Section 6.6 exercise 1, 3

Section 6.7 exercise 1-4, 7

Section 6.8 exercise 1, 10

# Problems for the exercise session Wednesday 30 Oct. from 14 o'clock in B2-085

**Problem 1** Make a sketch of the graphs of **two** different functions f(x) with the given data. Note: You are not supposed to find any algebraic expression!

a) f'(x) is negative for x < 5 and positive for x > 5

- b) f'(x) is positive for x < 10, negative for 10 < x < 15 and positive for x > 15
- c) f'(x) is negative for x < 5, f'(5) = 0, f'(x) is negative for 5 < x < 12 and f'(x) is positive for x > 12

**Problem 2** I figure 1 you see the graph of f'(x).

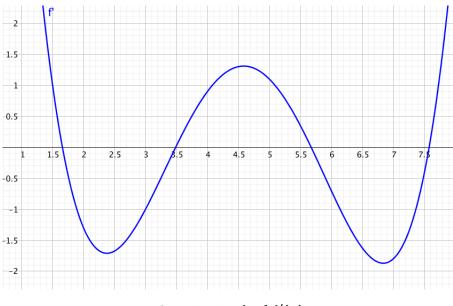

Figure 1: Graph of f'(x)

Determine if the statement is true or false.

b) f(2) < f(3)

c) f(4,5) > f(5)

i) f(4,5) > f(5)

- a) f'(2) < f'(3)
- d) f(x) has a (local)e) f(x) has a (local)f) the graph of f(x) has no<br/>norminimum for x = 3,5minimum for x = 3,5minimum for 2 < x < 3local minimum points
- g) f(x) decreases in the h) f(x) increases faster around x = 1,5 than around x = 5,5 interval [6,7]
- i) The derivative of f'(x) is positive for x = 7,6
- k) We cannot use the graph of f'(x) to determine if f(4,5) is positive

**Problem 3** In figure 2 you see the graphs of f(x) and f'(x) in the same coordinate system. Determine which is the graph of f(x) and which is the graph of f'(x) in (a-c).

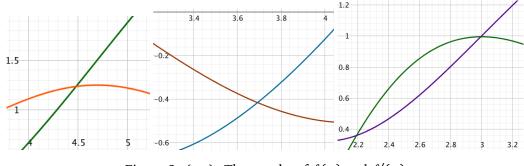

Figure 2: (a-c): The graphs of f(x) and f'(x)

**Problem 4** Determine the stationary points of f(x), where f(x) is strictly decreasing/increasing, and find (local) maximum and minimum points.

a) f'(x) = 4(x+1)(x-2)(x-5)b)  $f'(x) = (x-20)e^x$ c)  $f'(x) = \frac{(3x-5)(10-2x)}{x^2-6x+10}$ d)  $f'(x) = \ln(x) - 1,12$ e)  $f'(x) = \ln(x^2 - 6x + 10)$ f)  $f'(x) = \ln(x^2 - 8), (x > 2,9)$ g)  $f'(x) = e^{2x} - 4e^x + 3$ h)  $f'(x) = e^{x^2-3} - 2$ 

Problem 5 Determine maximum and minimum for these functions.

a) f(x) = 1000 - 0.2x and  $D_f = [50, 250]$ 

c) 
$$f(x) = 20 - \frac{1}{x-5}$$
 and  $D_f = [6, 15]$ 

- e)  $f(x) = 2x^3 33x^2 + 168x + 9$  and  $D_f = [2,5,8,6]$
- b)  $f(x) = 0.2x^2 2.8x + 19.8$  and  $D_f = [2, 12]$ d)  $f(x) = 10xe^{-0.1x}$  and  $D_f = [2, 30]$ f)  $f(x) = \ln(1 + e^{-x})$  and  $D_f = [4, 5]$

#### Problem 6

- a) We have  $f(x) = \sqrt{\ln[(x-4)^2] + 5} + x^3 4x$ . Calculate  $\frac{f(6)-f(2)}{4}$  and explain why there is a number *c* with 2 < c < 6 such that f'(c) = 48.
- b) We have a differentiable function f(x) with  $f(13) = 600e^{1,14} = f(17)$ . Explain why f(x) has a stationary point between 13 and 17.

**Problem 7** Compute the expression for the derivative of f(x).

a) 
$$f(x) = \ln(x^2 - 7x + 13)$$
 b)  $f(x) = e^{0.035x^2}$  c)  $f(x) = \sqrt{e^{2x} + 4x + 5}$  d)  $f(x) = \frac{x}{\ln(1 - x)}$ 

# Problem 8 (Multiple choice spring 2016, problem 12)

We have the function  $f(x) = \ln(x^2 + 4x + 5)$ . Which statement is true?

- (A) The function *f* is increasing in  $[2, \rightarrow)$
- (B) The function *f* is increasing in  $[-2, \rightarrow)$
- (C) The function *f* is increasing in  $\langle \leftarrow , 2 ]$
- (D) The function *f* is increasing in  $\langle \leftarrow, -2 ]$
- (E) I choose not to solve this problem.

Problem 9 (Multiple choice autumn 2016, problem 10)

We have the function  $f(x) = \frac{x^2 - 3x}{x+1}$ . Which statement is true?

(A) The function f has no local minimum points

- (B) The function *f* has one local minimum point, and it is x = -3
- (C) The function f has one local minimum point, and it is x = 1
- (D) The function f has several local minimum points
- (E) I choose not to solve this problem.

Problem 10 (Multiple choice spring 2018, problem 10)

- We have the function  $f(x) = x^2 e^{1-x}$ . Which statement is true?
- (A) The function *f* has one local maximum point  $x = a \mod a > 0$
- (B) The function f has several local maximum points
- (C) The function f has one local maximum point x = 0
- (D) The function *f* has one local maximum point x = a with a < 0
- (E) I choose not to solve this problem.

### Answers

## Problem 1

Compare with other students, ask the learning assistants!

#### Problem 2

Figure 3: True or false

## Problem 3

a) f(x): Green b) f(x): Brown c) f(x): Violet

### Problem 4

- a) Stationary points: x = -1, x = 2, x = 5. f(x) is strictly decreasing for  $x \le -1$ , f(x) is strictly increasing for  $-1 \le x \le 2$ , f(x) is strictly decreasing for  $2 \le x \le 5$ , f(x) is strictly increasing for  $x \ge 5$ . Hence x = -1 is a local minimum point, x = 2 is a local maximum point and x = 5 is a local minimum point.
- b) Stationary points: Only x = 20. f(x) is strictly decreasing for  $x \le 20$  and f(x) is strictly increasing for  $x \ge 20$ . Hence x = 20 is a global minimum point.

- c) Stationary points:  $x = \frac{5}{3}$  and x = 5. f(x) is strictly decreasing for  $x \le \frac{5}{3}$ , f(x) is strictly increasing for  $\frac{5}{3} \le x \le 5$ , f(x) is strictly decreasing for  $x \ge 5$ . Hence  $x = \frac{5}{3}$  is a local minimum point and x = 5 is a local maximum point.
- d) Stationary points: Only  $x = e^{1,12}$ . f(x) is strictly decreasing for  $x \le e^{1,12}$  and f(x) is strictly increasing for  $x \ge e^{1,12}$ . Hence  $x = e^{1,12}$  is a global minimum point.
- e) Stationary points: Only x = 3. f(x) is strictly increasing for all x. Hence x = 3 is nether a local minimum point nor a local maximum point (a *terrace point*).
- f) Stationary points: Only x = 3. f(x) is strictly decreasing for  $2,9 \le x \le 3$ , f(x) is strictly increasing for  $x \ge 3$ . Hence x = 3 is a global minimum point.
- g)  $f'(x) = (e^x 1)(e^x 3)$ . Stationary points: x = 0 and  $x = \ln(3)$ . f(x) is strictly increasing for  $x \le 0$ , f(x) is strictly decreasing for  $0 \le x \le \ln(3)$  and f(x) is strictly increasing for  $x \ge \ln(3)$ . Hence x = 0 is a local maximum point and  $x = \ln(3)$  is a local minimum point.
- h) Stationary points:  $x = \pm \sqrt{3 + \ln(2)}$ . f(x) is strictly increasing for  $x \le -\sqrt{3 + \ln(2)}$ , f(x) is strictly decreasing for  $-\sqrt{3 + \ln(2)} \le x \le \sqrt{3 + \ln(2)}$  and f(x) is strictly increasing for  $x \ge \sqrt{3 + \ln(2)}$ . Hence  $x = -\sqrt{3 + \ln(2)}$  is a local maximum point and  $x = \sqrt{3 + \ln(2)}$  is a local minimum point.

Problem 5 We use the extreme value theorem (Sec. 8.4, Thm. 8.4.1, p. 294).

- a)  $\min f(250) = 950 \quad \max: f(50) = 990$
- b) min f(7) = 10 max: f(2) = 15 = f(12)
- c) min: f(6) = 19 max: f(15) = 19,9
- d) min: f(30) = 14,94 max: f(10) = 36,79
- e) min: f(7) = 254 = f(2,5) max: f(8,6) = 285,23
- f) min: f(5) = 0,00672 max: f(4) = 0,01815

### Problem 6

- a)  $\frac{f(6)-f(2)}{4} = 48$ . Because f(x) is differentiable for all x the mean value theorem (Sec. 8.4, Thm. 8.4.2, p. 298) says that there is a number c with 2 < c < 6 such that f'(c) = 48.
- b) From the mean value theorem there is a number *c* in the interval (13, 17) such that f'(c) = 0 and then x = c is a stationary point.

#### Problem 7

(a) 
$$f'(x) = \frac{2x - 7}{x^2 - 7x + 13}$$
  
(c)  $f'(x) = \frac{e^{2x} + 2}{\sqrt{e^{2x} + 4x + 5}}$ 

(b) 
$$f'(x) = 0,07xe^{0,035x^2}$$
  
(d)  $f'(x) = \frac{(1-x)\ln(1-x) + x}{(1-x)[\ln(1-x)]^2}$
